

# ***Essentials of OFDM and MIMO***

Presented by: Ben Zarlingo, Agilent Technologies

# This Presentation

Intuitive Explanation of OFDM and MIMO in Digital Communications

Non-Mathematical Approach to Explain How they Work

Measurement & Display Implications

How & Why OFDM & MIMO Often Used Together

# Agenda

## OFDM Signal Overview

- Fundamental characteristics

- Benefits of OFDM

- Creating OFDM

- OFDM measurements

## MIMO & Other Smart Antenna Techniques Overview

- Benefits of MIMO

- How MIMO works

- MIMO and OFDM combined

- Single and multi-channel MIMO measurements

- Custom OFDM measurements and signal generation

# OFDM Overview

## OFDM: Orthogonal Frequency-Division Multiplexing

OFDM is a modulation format that achieves:

- high data throughput by transmitting on hundreds or thousands of carriers simultaneously.
- high spectral efficiency by spacing the carriers very closely.
- high data integrity by transmitting at a relatively slow symbol rate.

# Orthogonal Subcarriers

Overlapping Carriers But  
No Inter-Carrier Interference (Ideally!)

Frequency domain analog of zero inter-symbol interference

# OFDM Symbols & Subcarriers

## *Simplified view*

# OFDM Symbols & Subcarriers

*Real world view*

# OFDM vs. Single Carrier Modulation

## *Frequency Domain View*

### OFDM

### Single Carrier QAM

# OFDM vs. Single Carrier Modulation

## *Time Domain View*

### 802.11a OFDM

1 Sym = 64 Samples = 4.0 usec

### Single Carrier 64QAM

1 Sym = 1 Sample = .083 usec

# Sharing the Resource: OFDMA

“Multiple-Access”

User1 (low rate): 112 subcarriers

+

User2 (med-rate): 280 subcarriers

=

840 subcarrier signal

+

User3 (hi-rate): 448 subcarriers

# OFDMA Resource Map

**Example:  
802.16e  
Mobile WiMAX**

- Shows allocation of subcarriers by time and frequency.
- Subcarriers are usually grouped into logical channels.
- Each channel can have different modulation, power level, coding, etc.

# Pilot Structure

## No pilot

□ Data subcarrier

## Continuous pilot

■ pilot subcarrier

□ Data subcarrier

## Scattered pilot

■ pilot subcarrier

□ Data subcarrier

## Continuous pilot and scattered pilot

■ Scattered pilot subcarrier

■ Pilot Subcarrier

□ Data subcarrier

# OFDM Symbol Structure: Extending Symbol Length

$N_{pre} = DFTSize \times Gi$ , where  $Gi$  is defined as the guard interval in parameter GuardInterval.

# Summary: How OFDM Achieves its Goals

## 1. High throughput:

- An 800-subcarrier system with 64QAM mapped to each subcarrier can transmit  $800 \times 8 = 6400$  bits per symbol.

## 2. Bandwidth efficiency:

- With DSP techniques (FFT and IFFT), subcarrier spacing can be reduced to theoretical minimum, i.e. mathematically *orthogonal* (don't expect to see individual subcarriers!)

## 3. Data integrity: Multi-subcarrier symbol structure has advantages

- Symbol is long relative to most impulse noise.
- Single-freq interferer only disturbs 1-2 subcarriers, not entire signal.
- Built-in amplitude and phase references (pilots) allow signal to be re-synchronized and/or equalized for each symbol.
- Symbol can be *cyclically extended* for multipath immunity

# OFDM Signal Analysis

1. Isolate waveform for 1 symbol;  
synchronize in Freq,  
Time, Phase
2. Perform FFT
3. Map subcarrier I-Q  
values back to  
QAM constellations
4. Compute standard  
constellation metrics  
(EVM, SNR, etc.) for  
each subcarrier in  
each symbol

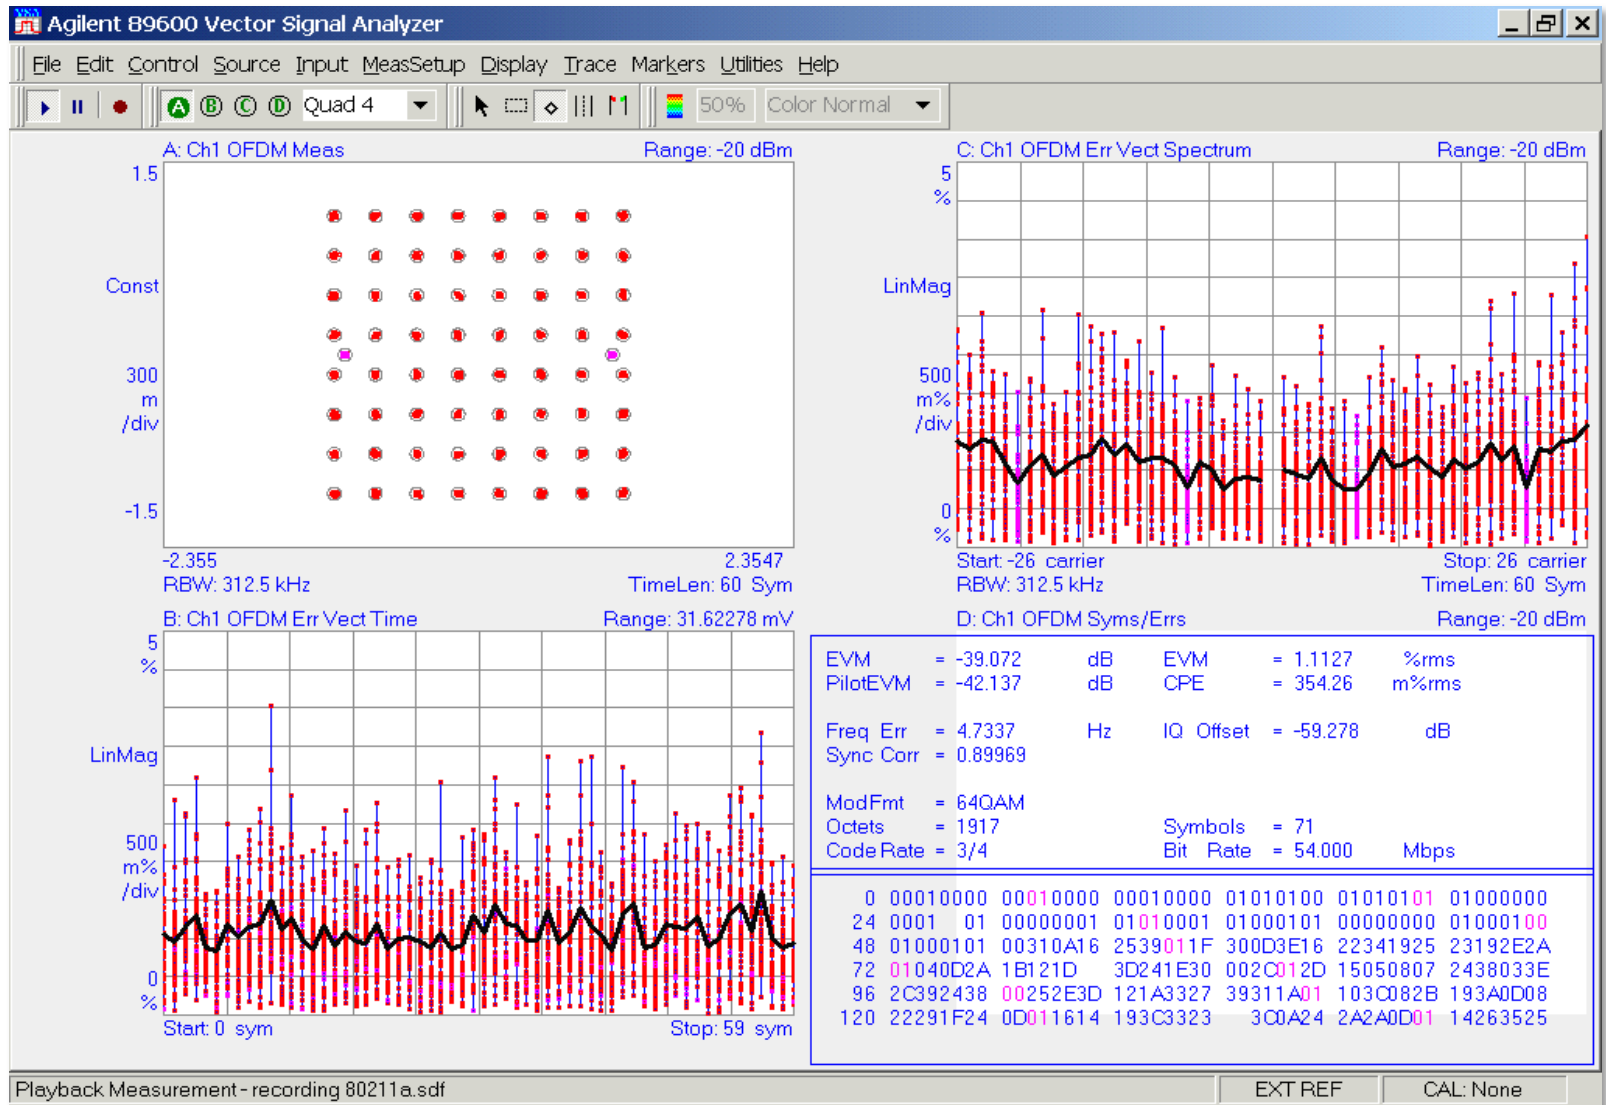

# How to Display OFDM Signals

## Measuring Modulation Quality

# Measurement & Display Examples

## Amplitude & Phase Drift

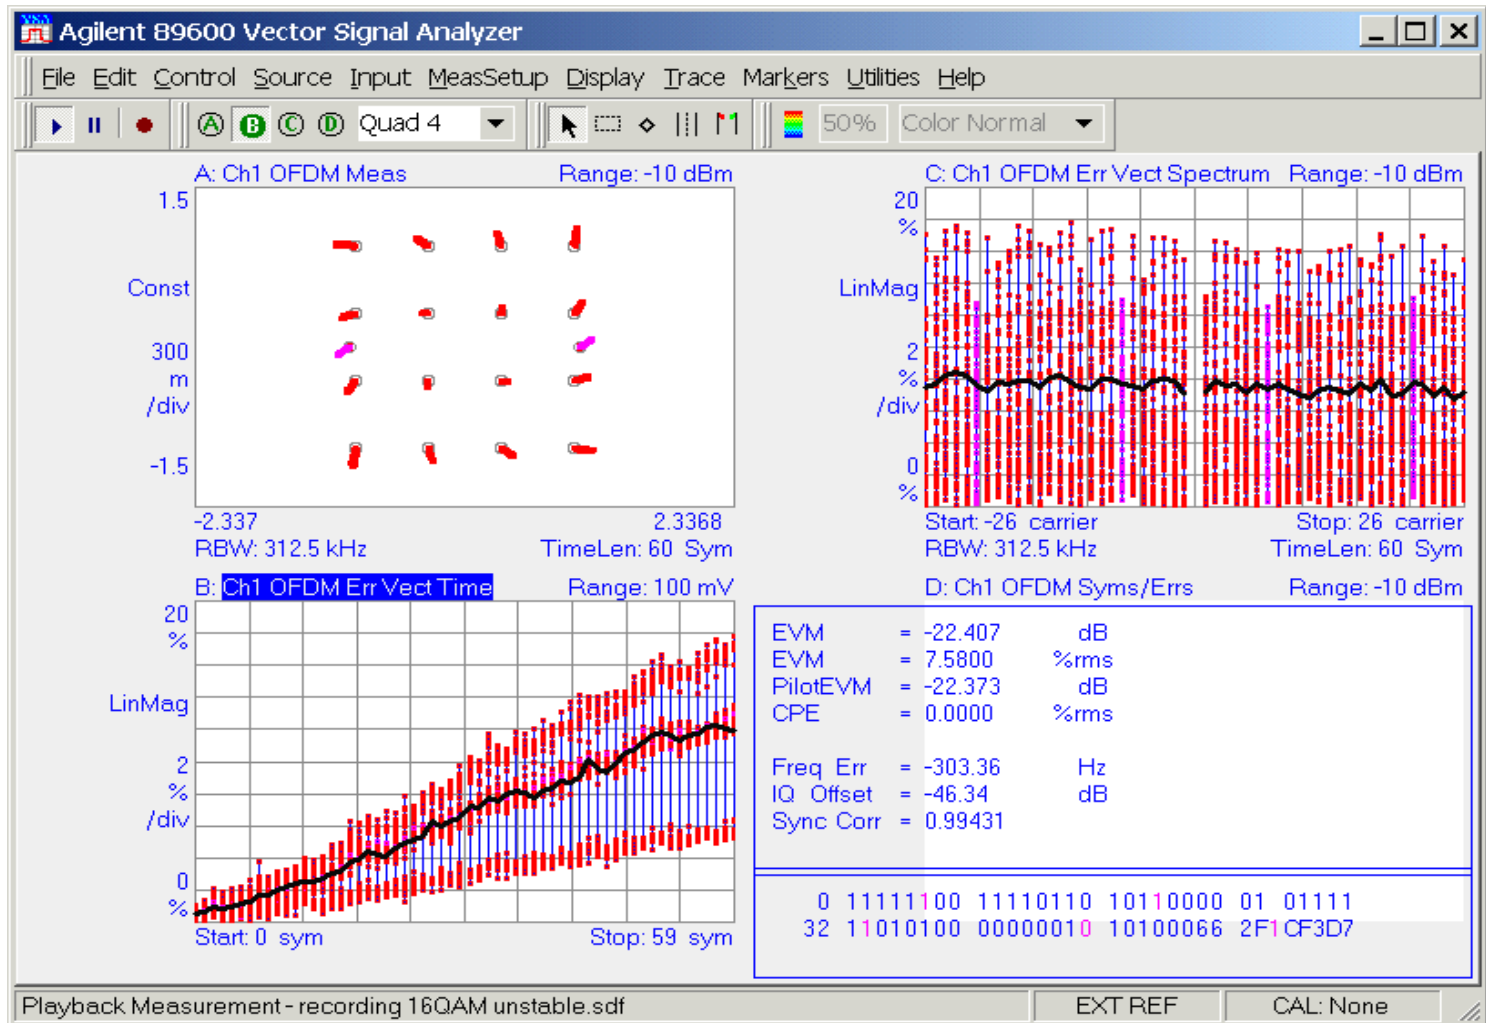

- Typical measurements & displays
- Effect of pilot tracking

## Combining Vector & Demodulation Displays

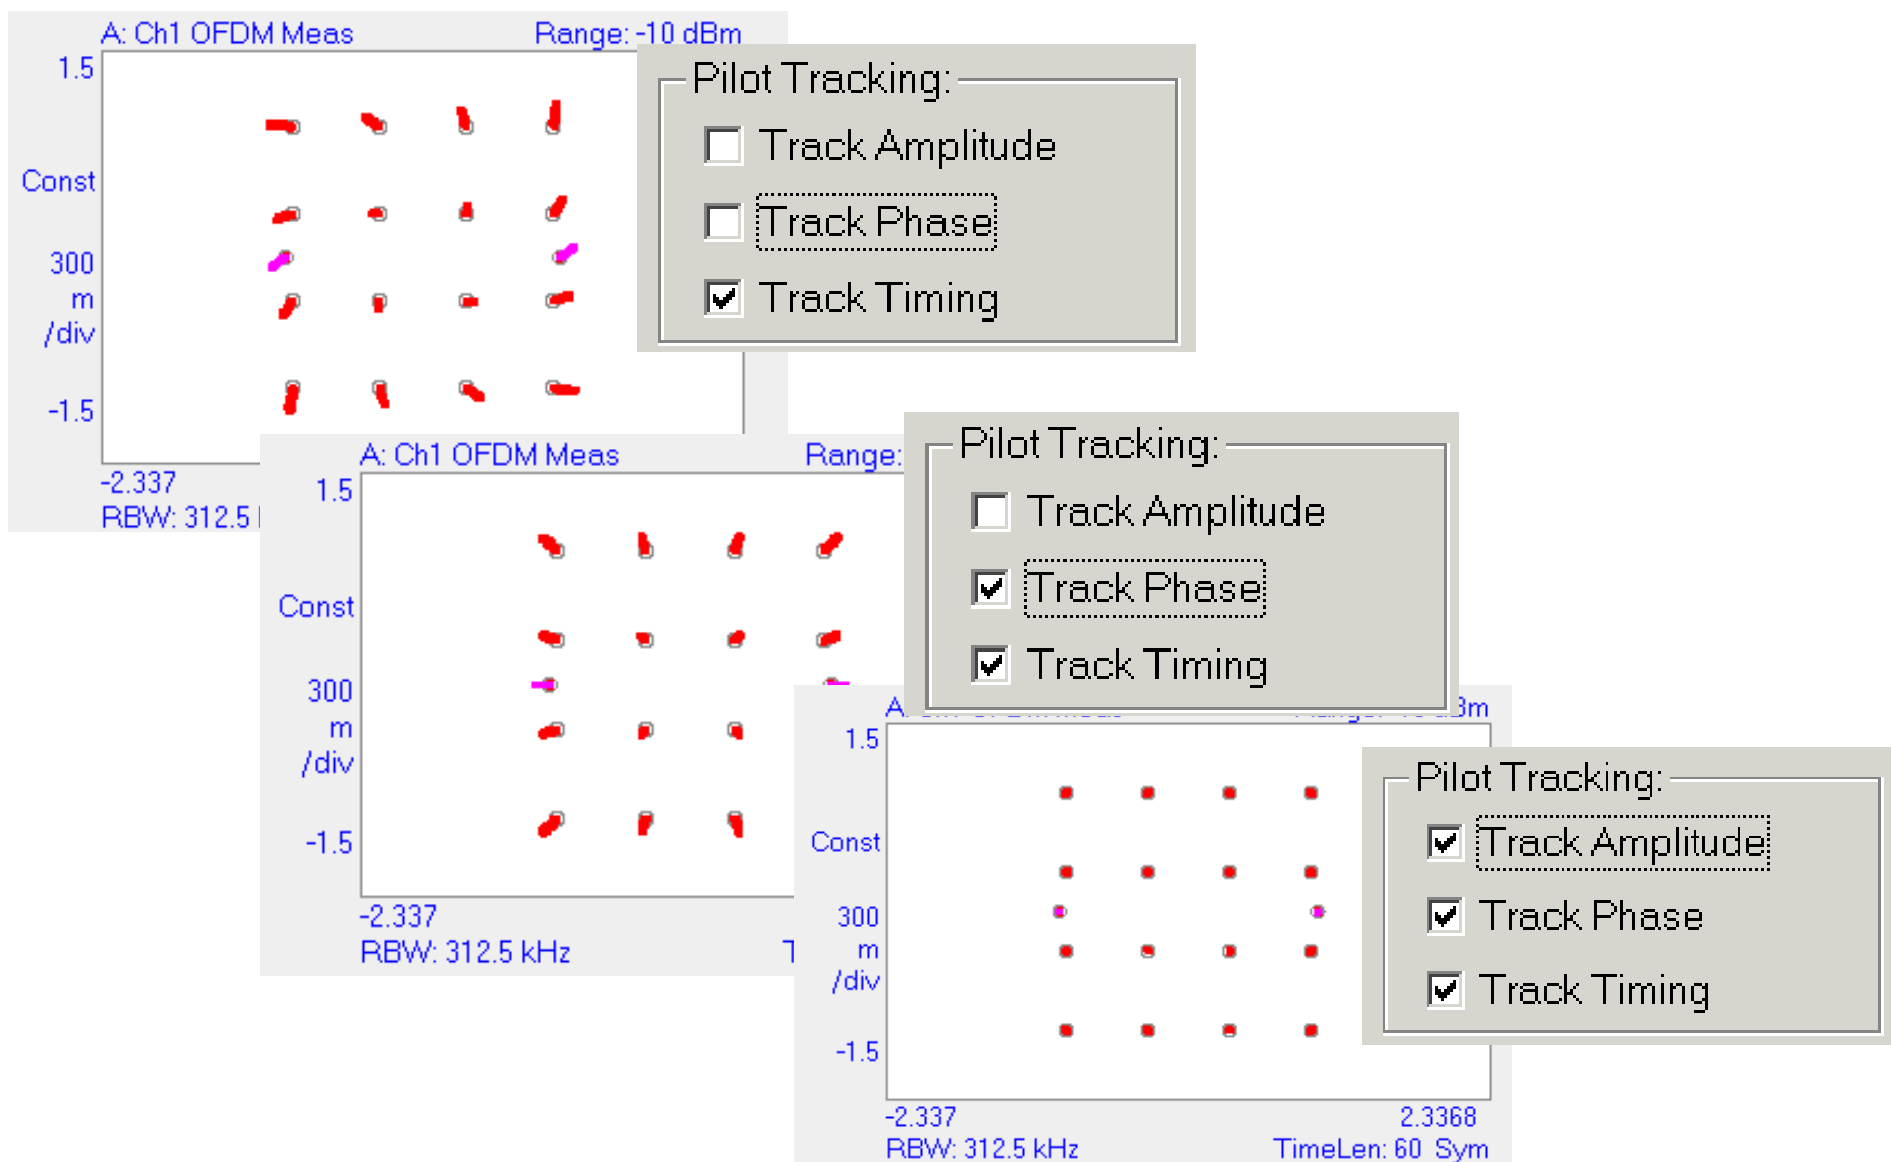

# OFDM Impairments Example

## Amplitude & Phase Drift

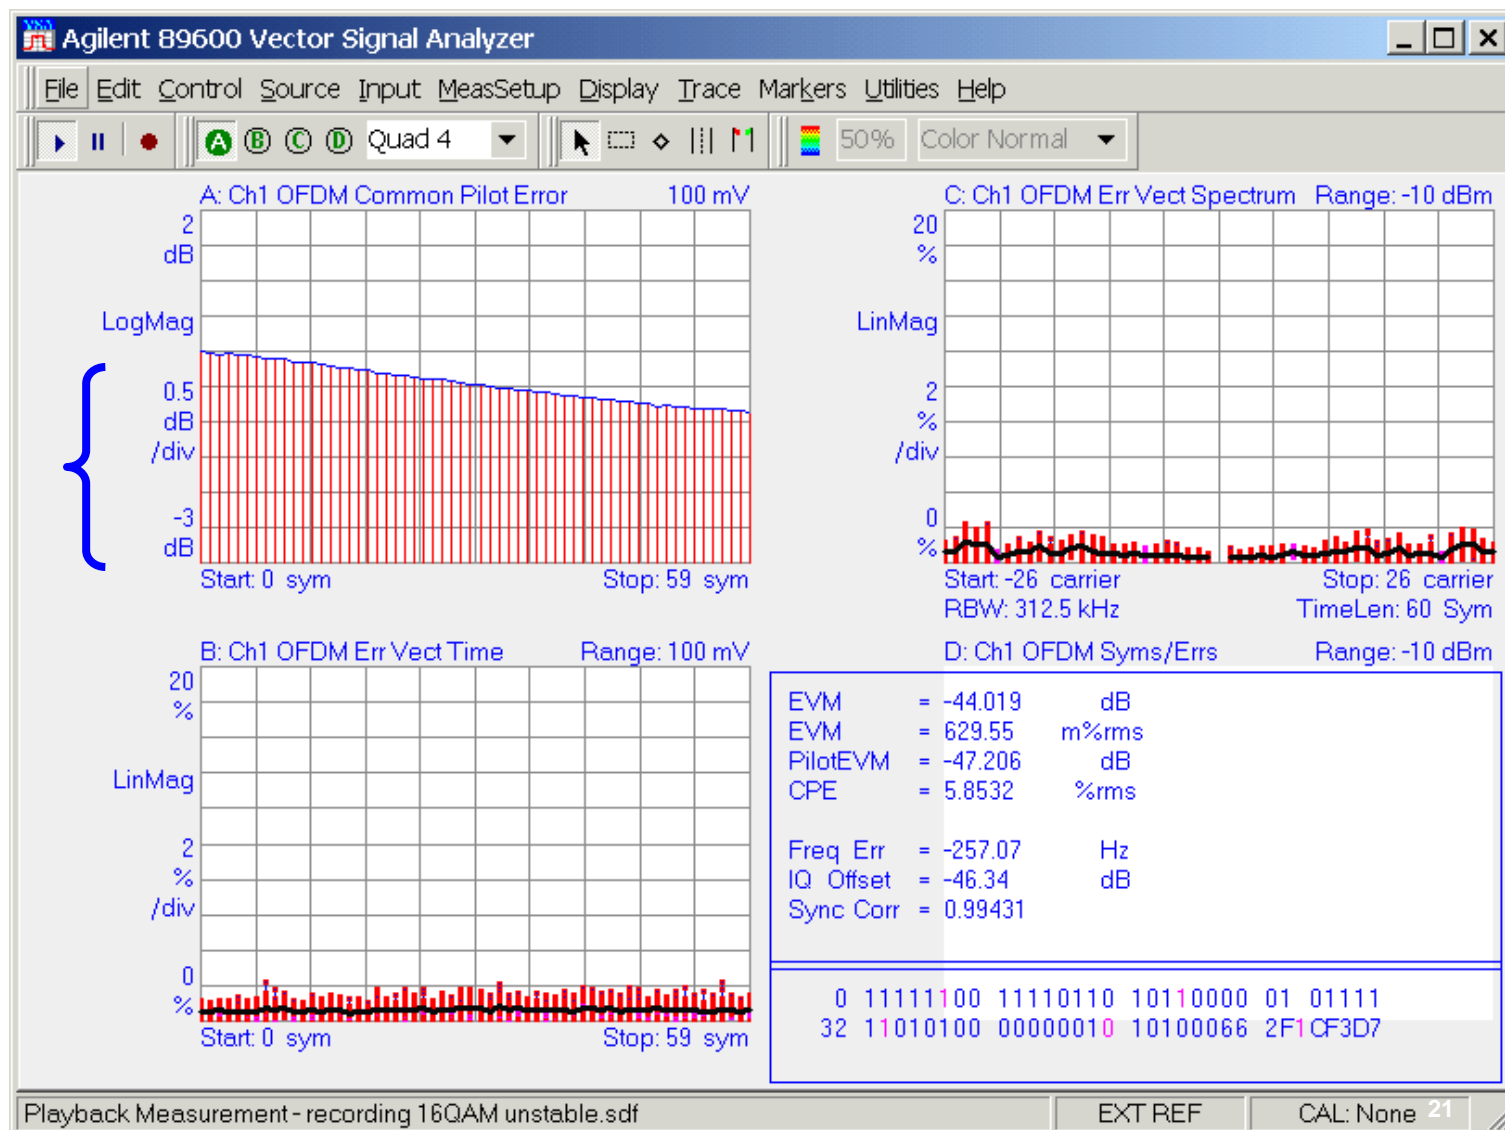

# Pilot Tracking Compensates for or Hides Impairments

# Common Pilot Error Display Shows the Defect Removed

~1 dB ampl.  
droop in  
240 uSec

EVM looks  
fine with pilot  
tracking ON.

# OFDMA--Spectrogram & Power Envelope

# MIMO Overview

**MIMO** is the Science of Getting From

**THIS**

to

**THIS**

The "channel"

Increased capacity from a given spectrum occupancy

# System & Antenna Configurations, Terms

“Input” and “Output” Refer to the Transmission Channel

**SISO**

**MISO**

**SIMO**

**MIMO**

# Why MIMO?

MIMO is a **Capacity Enhancement** Scheme

- Evading Shannon's limit!
- Can Trade Capacity for more range or ??

CDMA, OFDM, etc. are **Multiplexing** Schemes

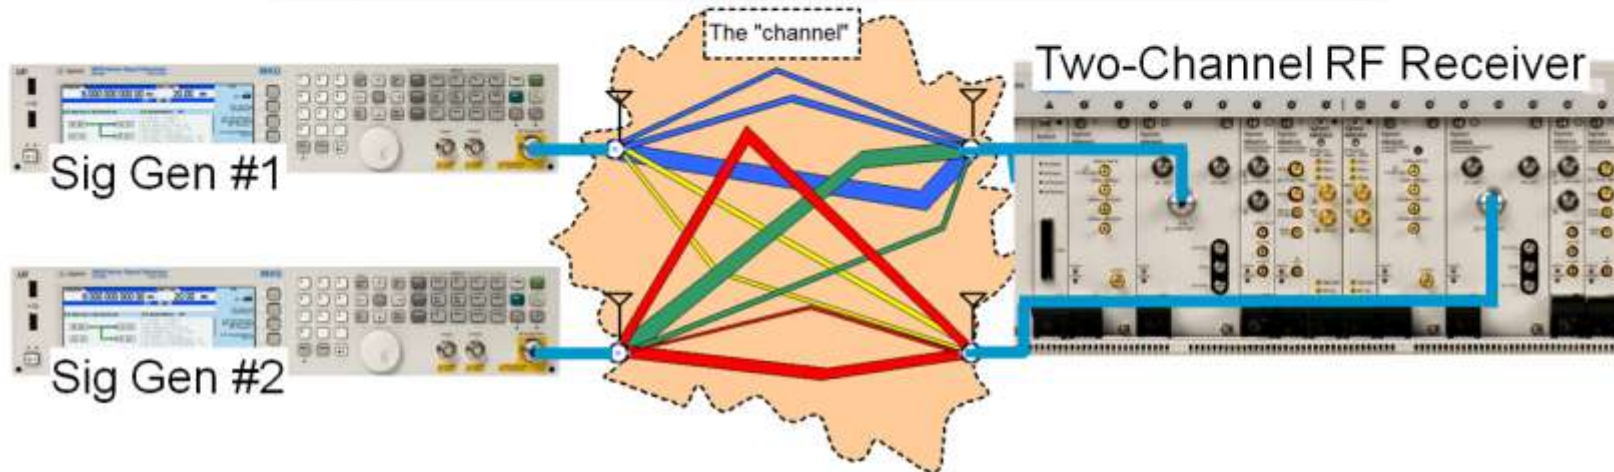

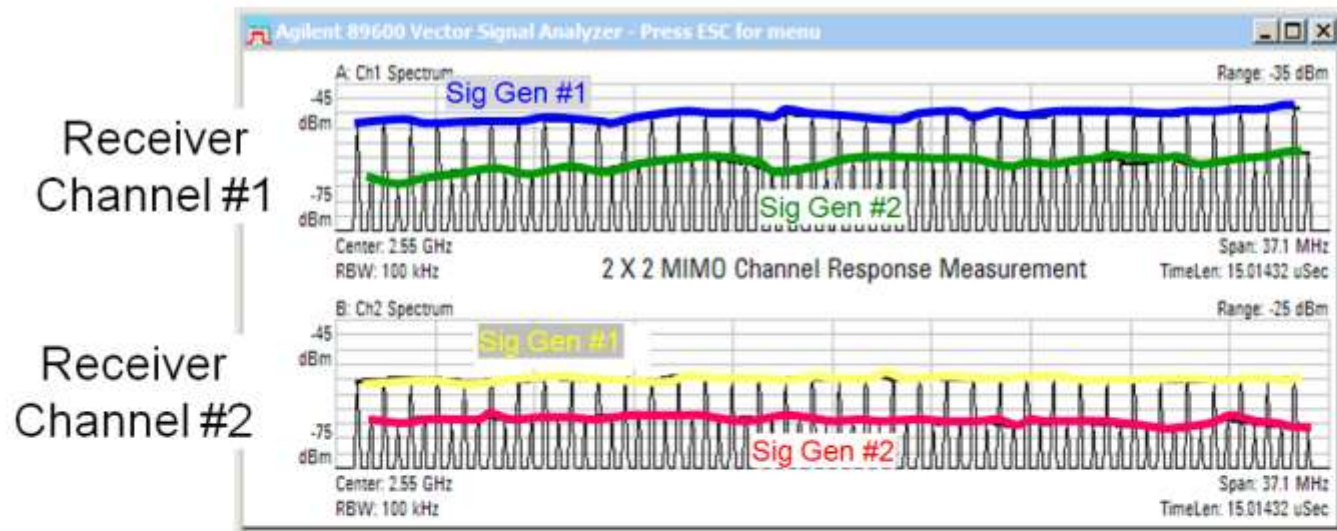

- Dividing capacity among users, frequencies
- Better operation in impaired conditions
- "Shannon Limit" still applies!

# DEMONSTRATION: Live 2x2 Channel

Two sources generate multi-tone signals with 1 MHz spacing, offset by 500Khz to identify each source at receiver (2-ch. VSA) antennas

Movements in the environment near the antennas show how the four independent radio paths (color coded) can be identified

# Frequency Response Example

**Antenna 1:  
5 dB Ripple**

**Antenna 2:  
25 dB Null**

# MIMO exposed (The 2 x 2 Instance)

The real channel  
(complicated)

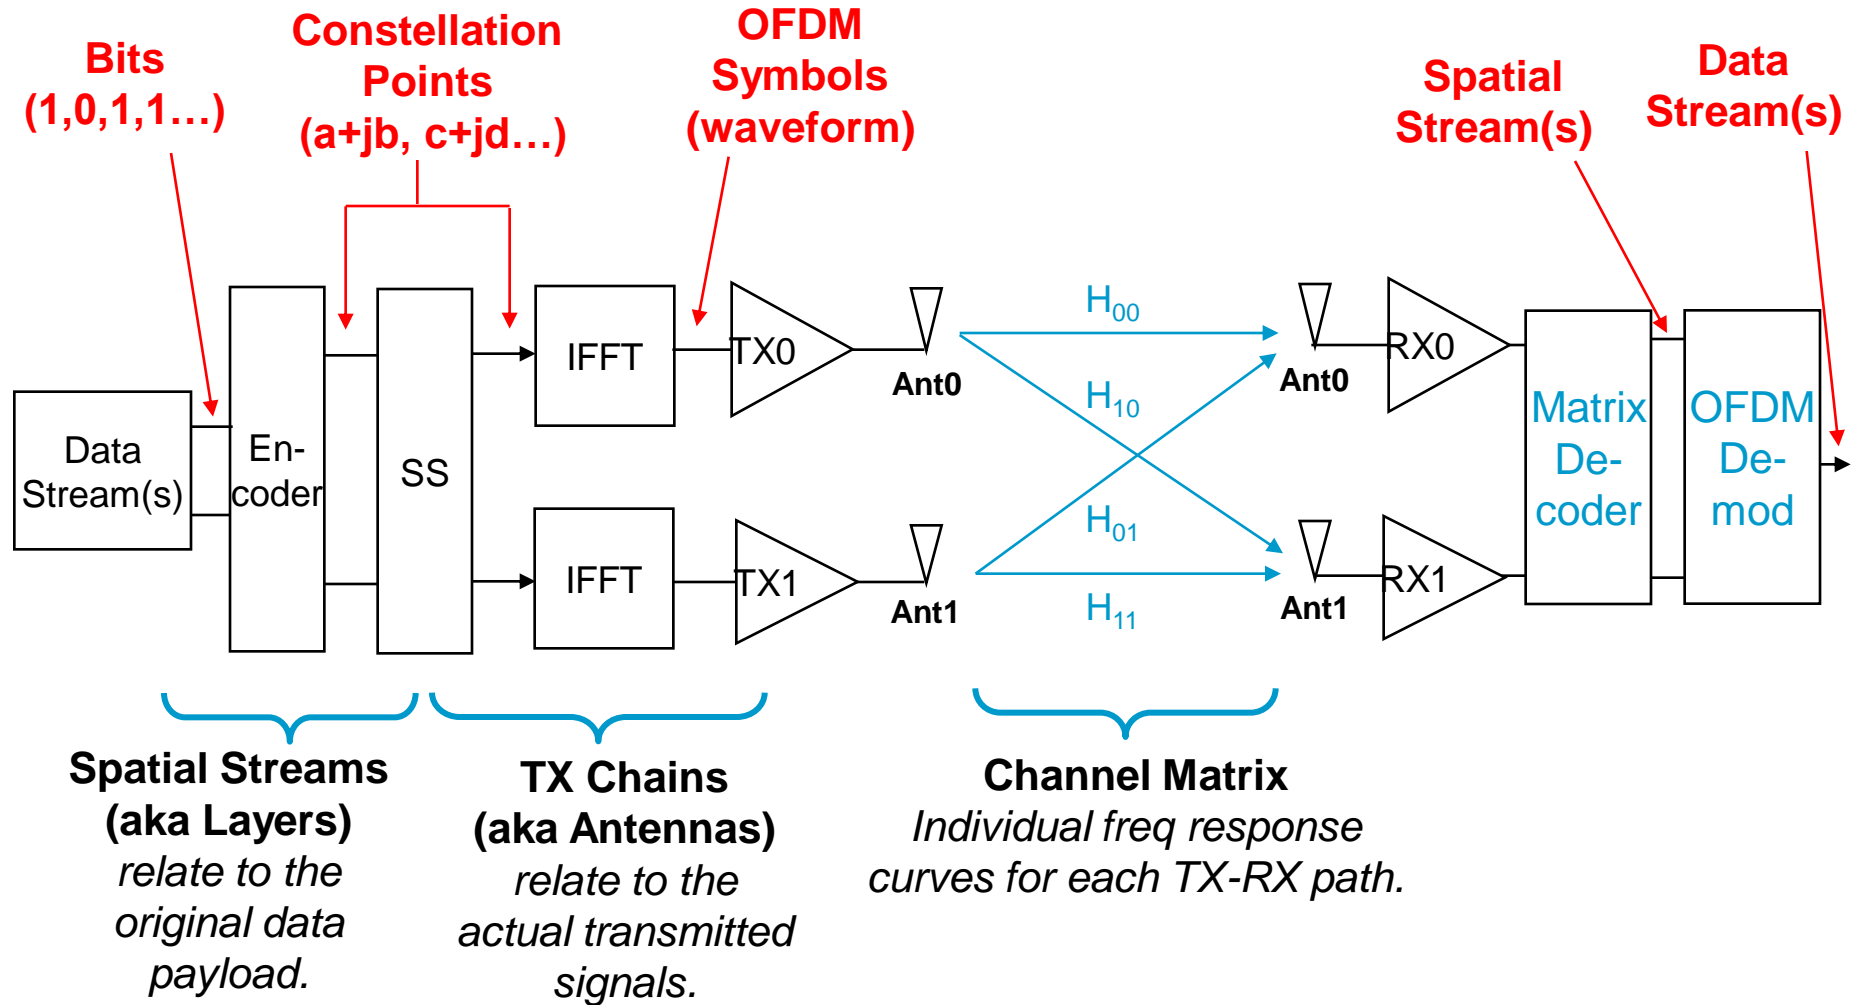

The channel for one  
OFDM sub-carrier  
during the course of  
a packet

Solving the equations

# MIMO – Data & Spatial Streams, Channels

## 2x2 Example

# MIMO Measurement Types

All the Basics, Plus More, Including Linked Channels

All Traditional Spectrum, Network, Power, Timing

Basic Modulation Quality

Isolation/Coupling/Crosstalk

Frequency Responses (multiple)

General Modulation Impairments

Proper MIMO Operation, Signal Content

MIMO Signal Separation

Optimization: Cost, signal quality, size, power consumption, complexity, antenna configuration

# Analysis Approaches

## Switch Off One Channel

- Simple, generally less expensive
- Use established equipment, approaches
- Results with limited applicability

## Single-Input Measurements of 2 - 4 Transmitters

- Transmitters combined deliberately or incidentally
- Some signals can be separated by frequency or time
- No Matrix decoder

## Multi-Channel Measurements, Two or More

- Signal processing to restore 40+ dB measurements
- Measure cross-channel parameters and how they vary with configuration changes

# MIMO Signal Recovery: Measuring Matrix Coefficients

# Recovering the channel coefficients (WiMAX Wave 2 example)

In WiMAX and LTE, more subcarriers are allocated as pilots

## Pilot location changes from symbol to symbol

Pilot power is boosted to ensure errors from recovering the training signal do not dominate the demodulator performance

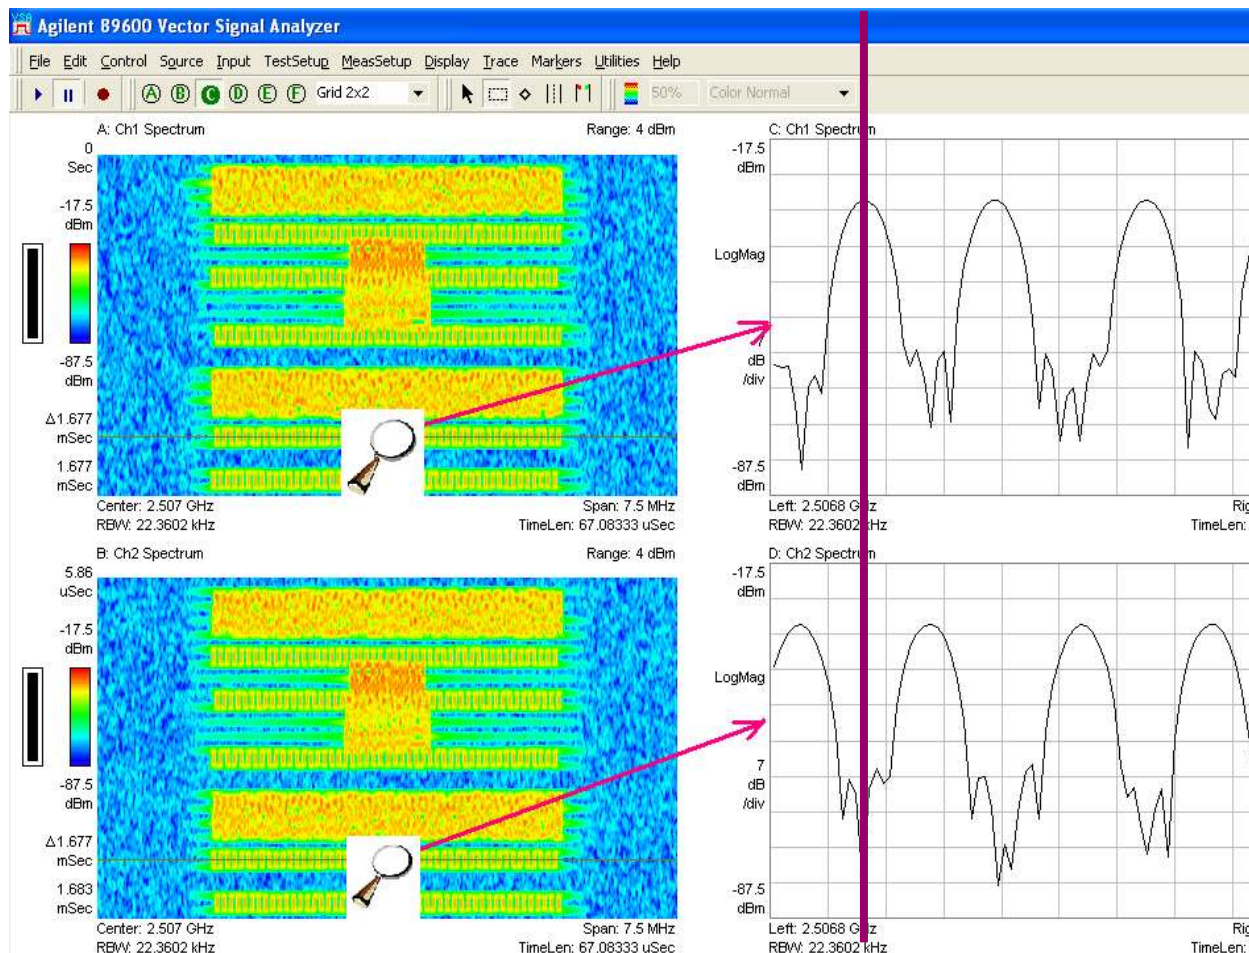

# MIMO Signal Recovery – Spectrum View

The traces in this LTE signal show how the Reference Signals (pilots) are on different frequencies at any instant in time

Spectrograms on left show spectrum versus time (time is vertical axis)

Unlike 802.16 OFDMA, the LTE RS (pilots) not present on all symbols

# Frequency vs. Power in Burst: 802.11n (draft ver.)

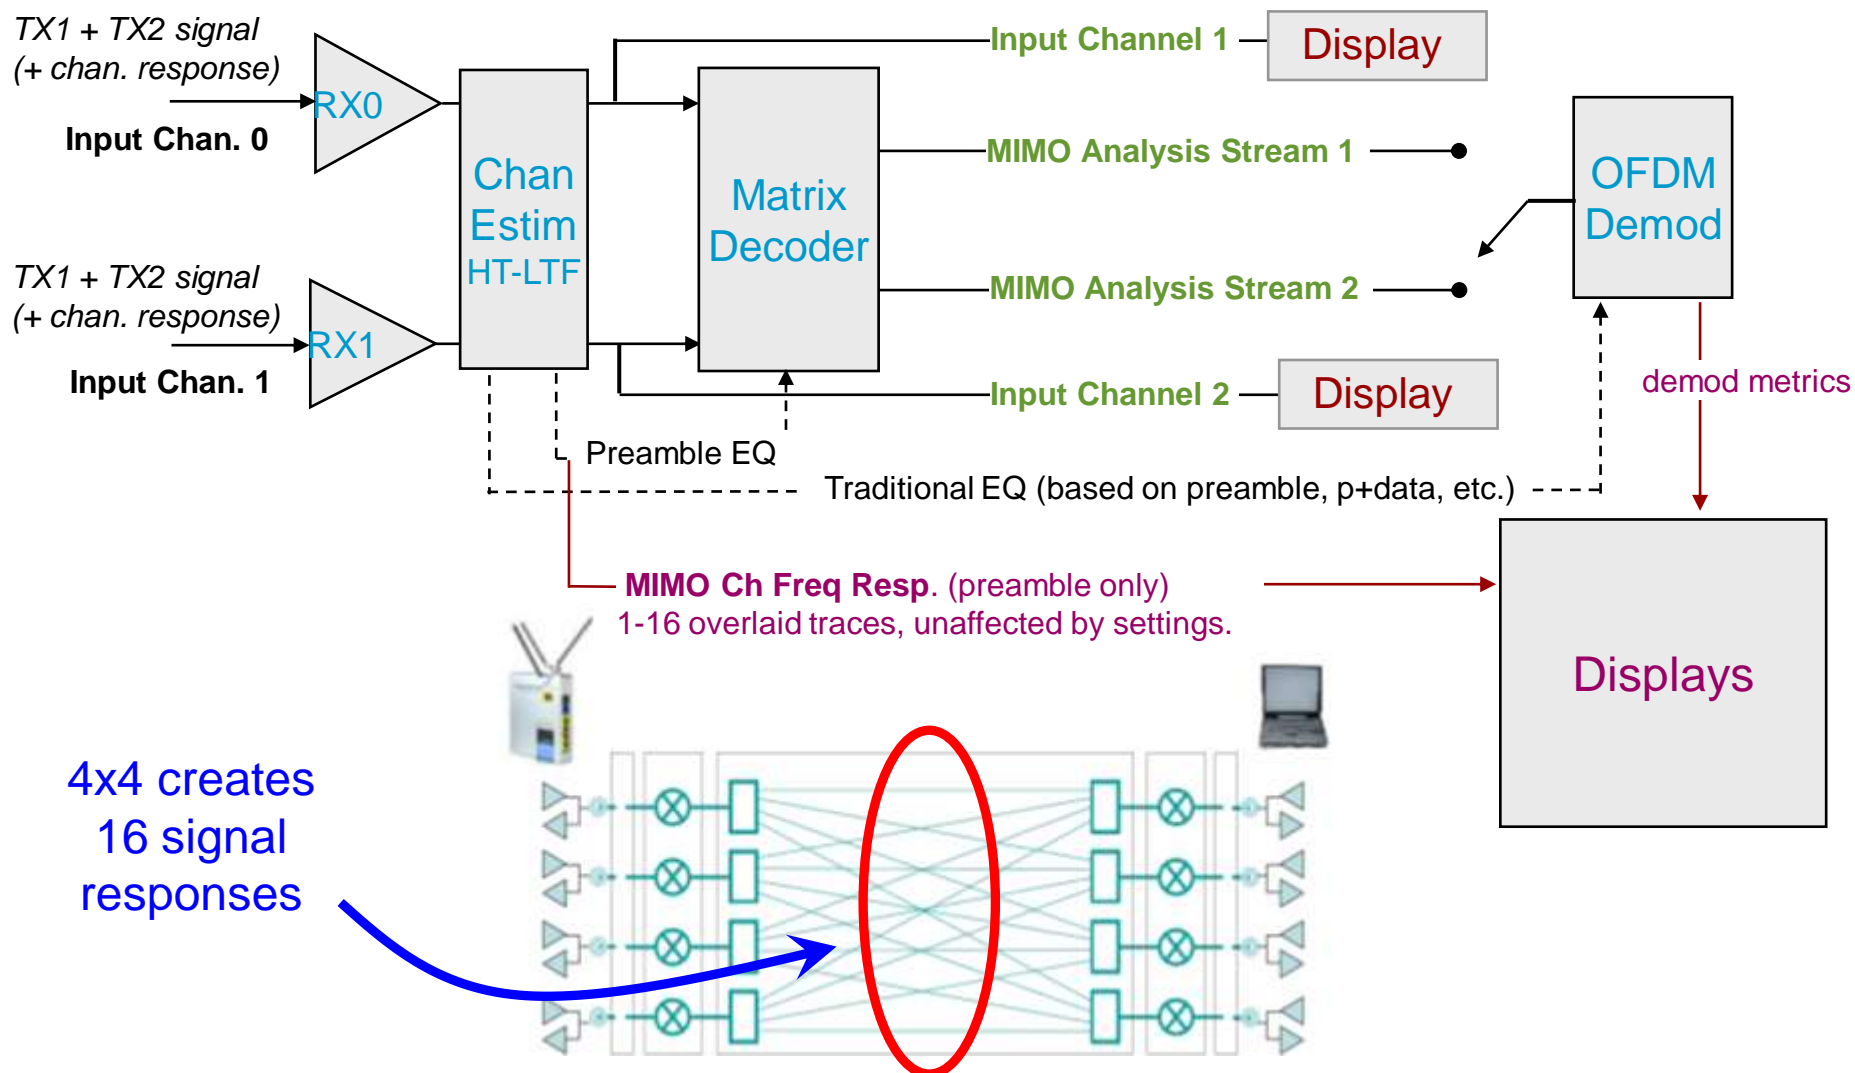

# Channel Training Varies with Technology

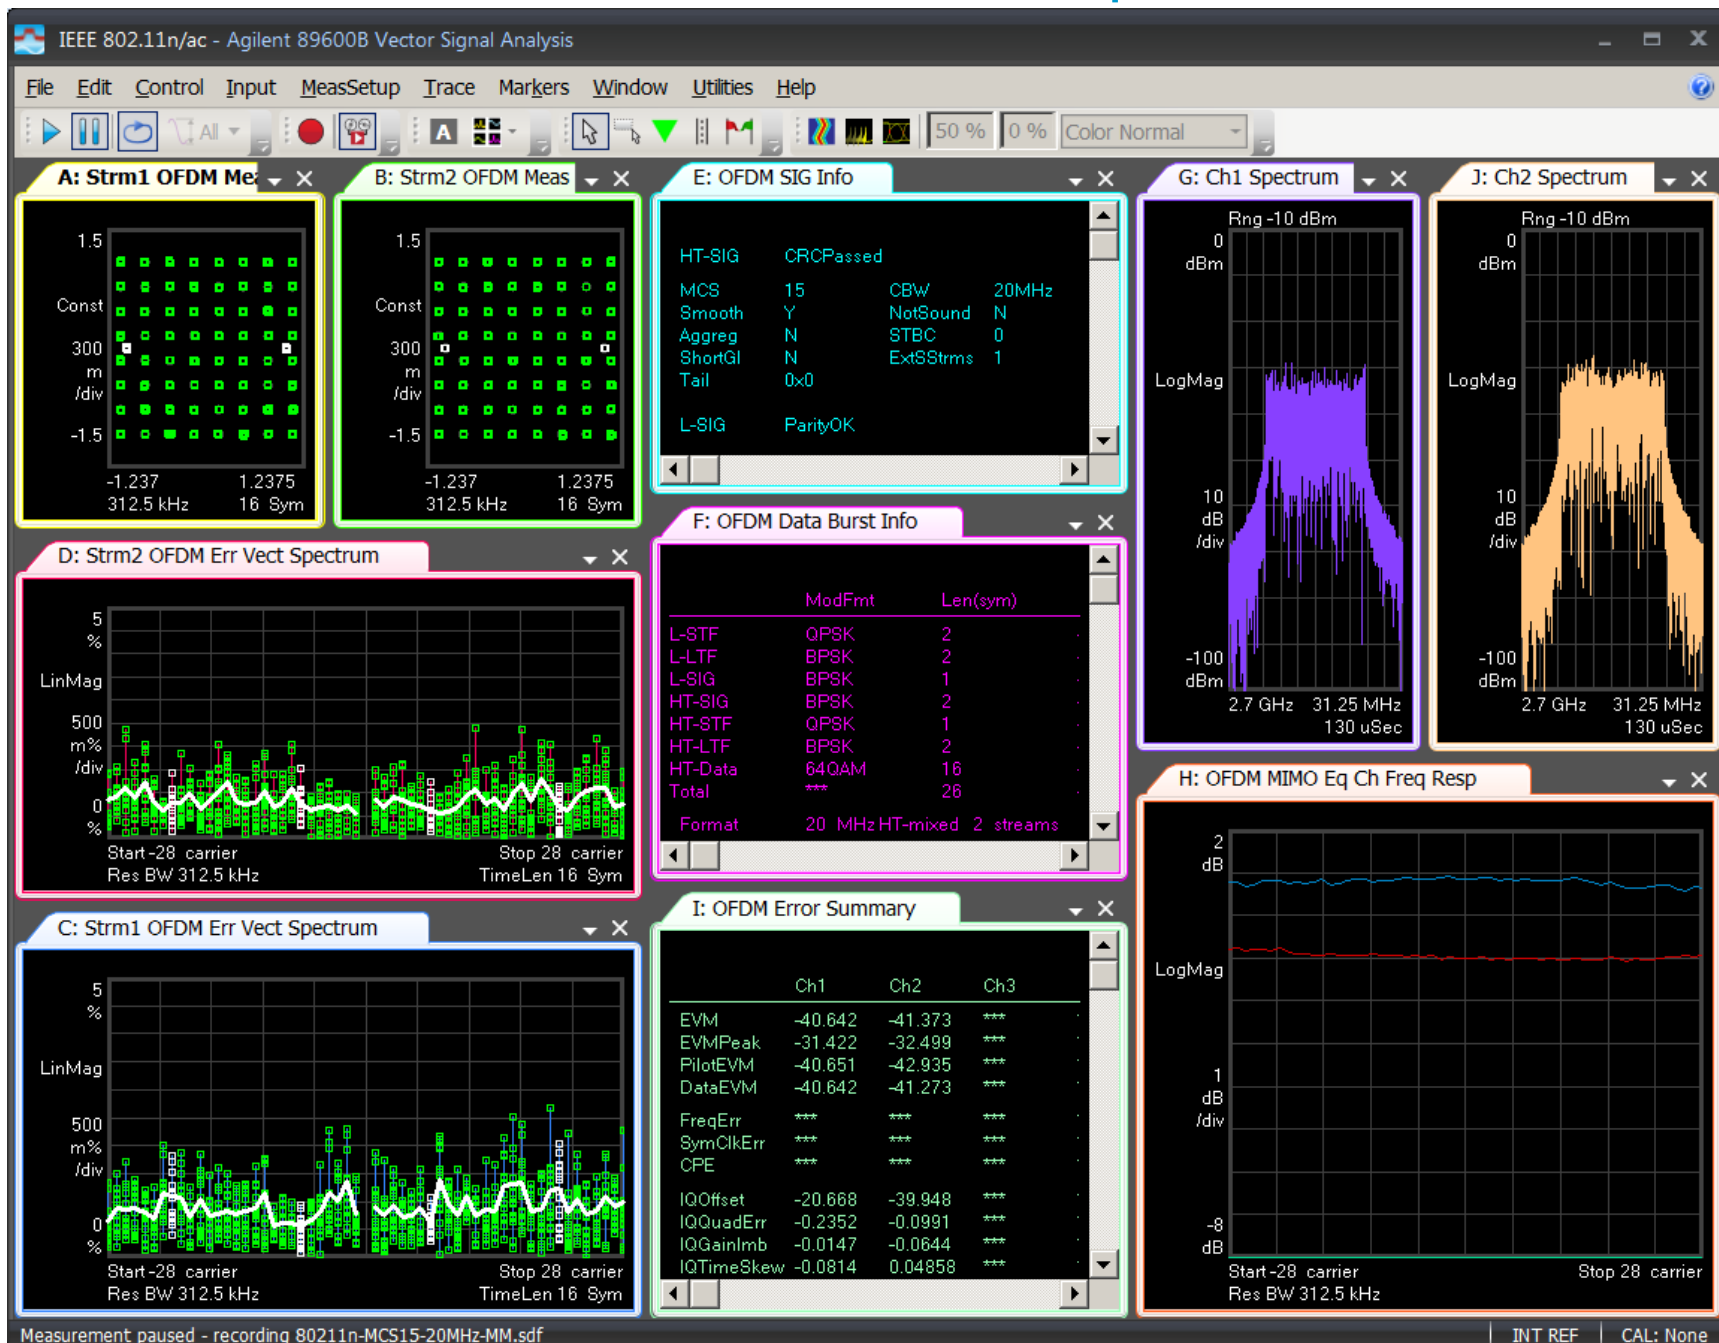

| 3GPP LTE  | WiMAX  | 11n Wireless LAN   |
|---|--|--|
| <p>Reference signals (pilots) use different subcarriers for each transmitter</p> <p>The QPSK Reference signals are transmitted every 3<sup>rd</sup> or 4<sup>th</sup> symbol, mixed with data</p> | <p>BPSK Pilot subcarriers use different frequencies. Their positions vary symbol by symbol within a subframe, but are constant from frame to frame.</p> <p>Subcarrier coverage builds over several symbols, allowing interpolation</p> <p>Details depend on the zone type (e.g. PUSC, AMC)</p> | <p>A preamble is used for training. The same subcarriers are used for all transmitters. Signals are separated by a CDMA code</p> <p>4 orthogonal QPSK pilots are used (6 for 40MHz), sharing the same subcarriers. They are never transmitted without data</p> |
| <p><b>HSPA+ uses code channels on the Common Pilot Channel, CPICH, with unique symbol bit patterns having different locations in the OVSF code domain</b></p>                                     |  |  |

# VSA MIMO Signal Analysis

*Conceptual Model--Only 2x2 shown for clarity*

# Demodulation Results: Const, Time, Spectrum, Tabular

# Some Cross Channel Measurements Can Be Made With a Single Input Analyzer

Applies to LTE, WiMAX

Using a power combiner removes ANY uncertainty due to timing jitter or calibration

The demodulation process recovers the time and phase relationship between the transmitters at the power combiner input

Cable calibration may still be required

# MIMO Condition Number

**What it is:**

- a) A way to see if your MIMO system is functioning correctly
- b) A short term indication of the SNR you need to recover a MIMO signal

**How you calculate it:** Find the *singular values* of the channel matrix, and take the ratio of the highest / lowest

## Matrix condition number

**Ratio of max/min singular values of a matrix. Value always  $\geq 1$  (or  $\geq 0$  dB). If this value is greater than signal SNR it is likely the MIMO separation of data streams will not work correctly.**

# Frequency Response by Channel & Stream

|         |         |            |               |
|---------|---------|------------|---------------|
| Trace B | Marker: | -3 carrier | -5.445 dB     |
| Trace C | Marker: | -3 carrier | -103.1045 deg |
| Trace E | Marker: | -3 carrier | -1.524 dB     |
| Trace F | Marker: | -3 carrier | 49.1482 deg   |

## Channel frequency responses

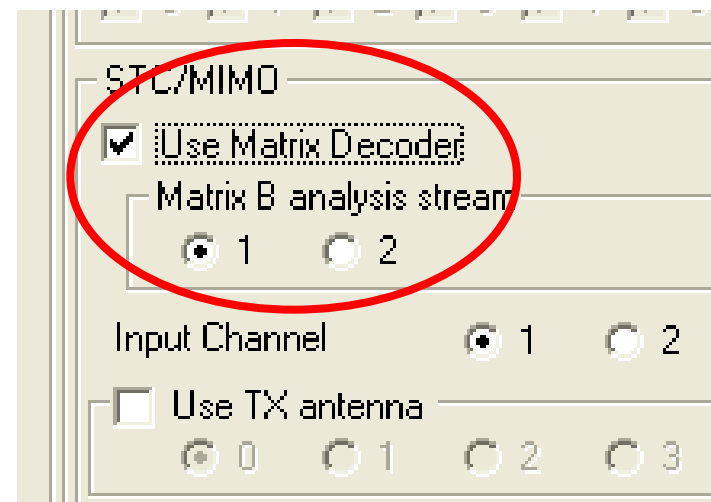

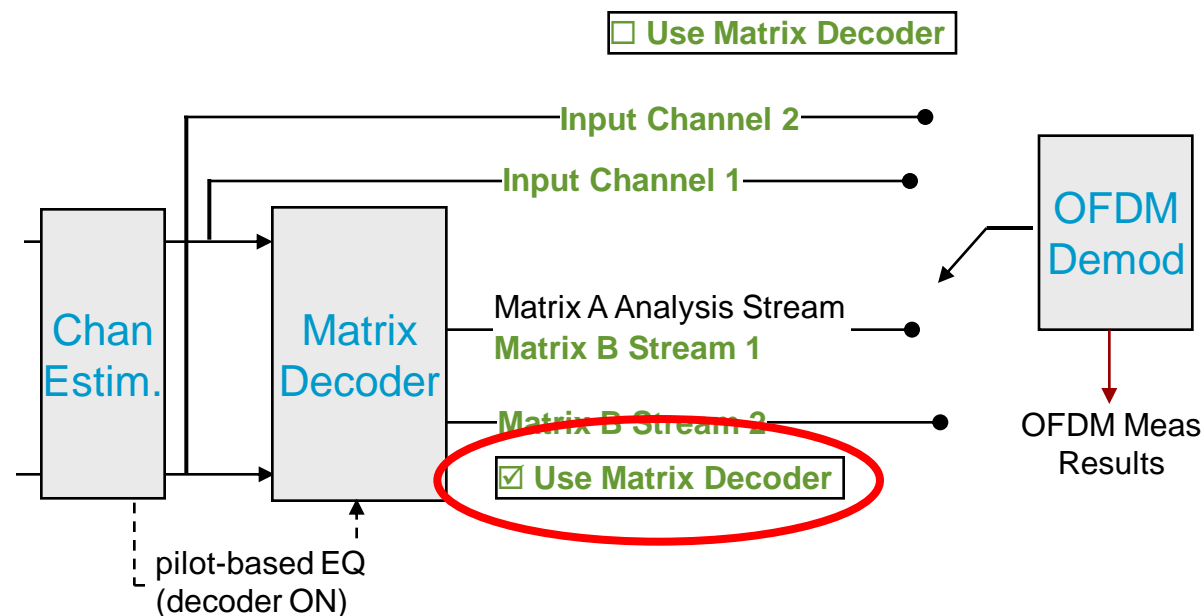

Shows the transfer functions (mag & phase) for each channel.  
Available for all data streams.

# MIMO 4x4 Frequency Response

## 802.11n Example: One Weak Channel

# Matrix Decoder & Crosstalk

## Measurements Made **Without** Matrix Decoder

- Effects of crosstalk are included in measurement
- Crosstalk degrades EVM
- Error due to crosstalk can hide other errors

## Measure Both Ways to Understand Error Contribution of Crosstalk

# Analyzing Proprietary OFDM signals

## Demodulator needs to know

- basic time, freq and FFT parameters.
- which subcarriers are pilots?
- which subcarriers are preambles?
- what are the expected I-Q values for each preamble and pilot subcarrier?
- what is the expected modulation format for each data subcarrier?

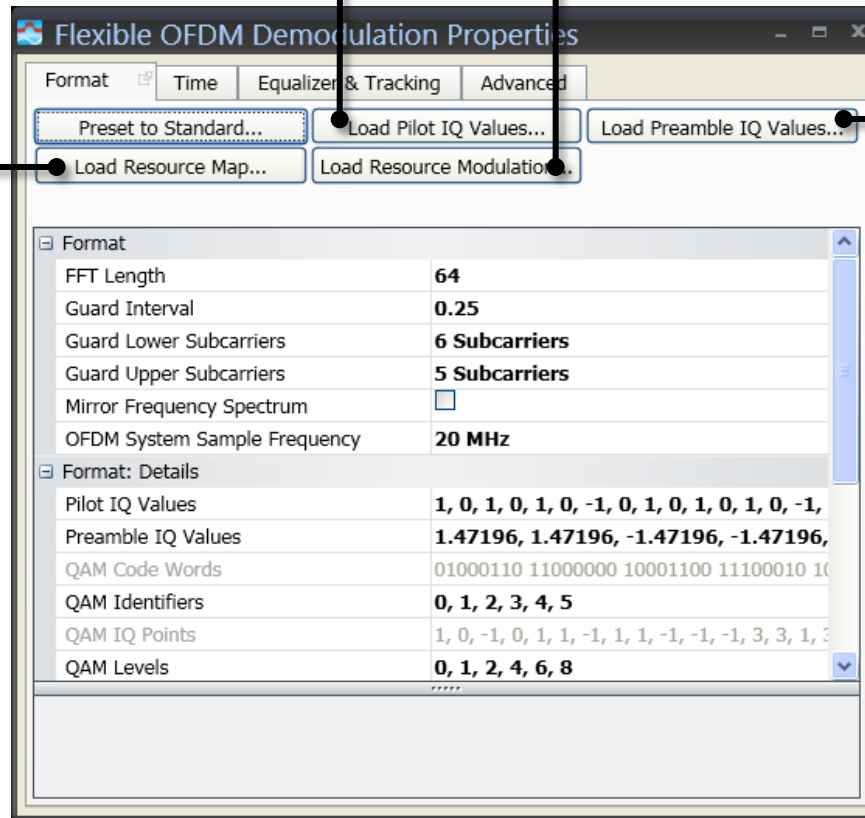

# Analyzing Proprietary OFDM Signals (cont)

Load Config File:  
**Pilot IQ Values**

Load Config File:  
**Subcarrier Modulation**

Load Config File:  
**Subcarrier Types**

Load Config File:  
**Preamble IQ Values**

The image shows a software window titled "Flexible OFDM Demodulation Properties". It has four tabs: "Format", "Time", "Equalizer & Tracking", and "Advanced". The "Format" tab is selected. At the top of the "Format" tab, there are four buttons: "Preset to Standard...", "Load Pilot IQ Values...", "Load Preamble IQ Values...", and "Load Resource Map...". Arrows from external text labels point to these buttons: "Load Pilot IQ Values" points to the "Load Pilot IQ Values..." button, "Load Subcarrier Modulation" points to the "Load Resource Modulation..." button (which is partially obscured), "Load Subcarrier Types" points to the "Load Resource Map..." button, and "Load Preamble IQ Values" points to the "Load Preamble IQ Values..." button. Below the buttons is a table with two sections: "Format" and "Format: Details". The "Format" section contains parameters like FFT Length (64), Guard Interval (0.25), Guard Lower Subcarriers (6 Subcarriers), Guard Upper Subcarriers (5 Subcarriers), Mirror Frequency Spectrum (unchecked), and OFDM System Sample Frequency (20 MHz). The "Format: Details" section contains parameters like Pilot IQ Values, Preamble IQ Values, QAM Code Words, QAM Identifiers, QAM IQ Points, and QAM Levels.

| Format                       |                          |
|------------------------------|--------------------------|
| FFT Length                   | 64                       |
| Guard Interval               | 0.25                     |
| Guard Lower Subcarriers      | 6 Subcarriers            |
| Guard Upper Subcarriers      | 5 Subcarriers            |
| Mirror Frequency Spectrum    | <input type="checkbox"/> |
| OFDM System Sample Frequency | 20 MHz                   |

| Format: Details    |  |

**Basic FFT  
Parameters**

# Configuration Files for Analyzing Custom OFDM

## Configuration Files

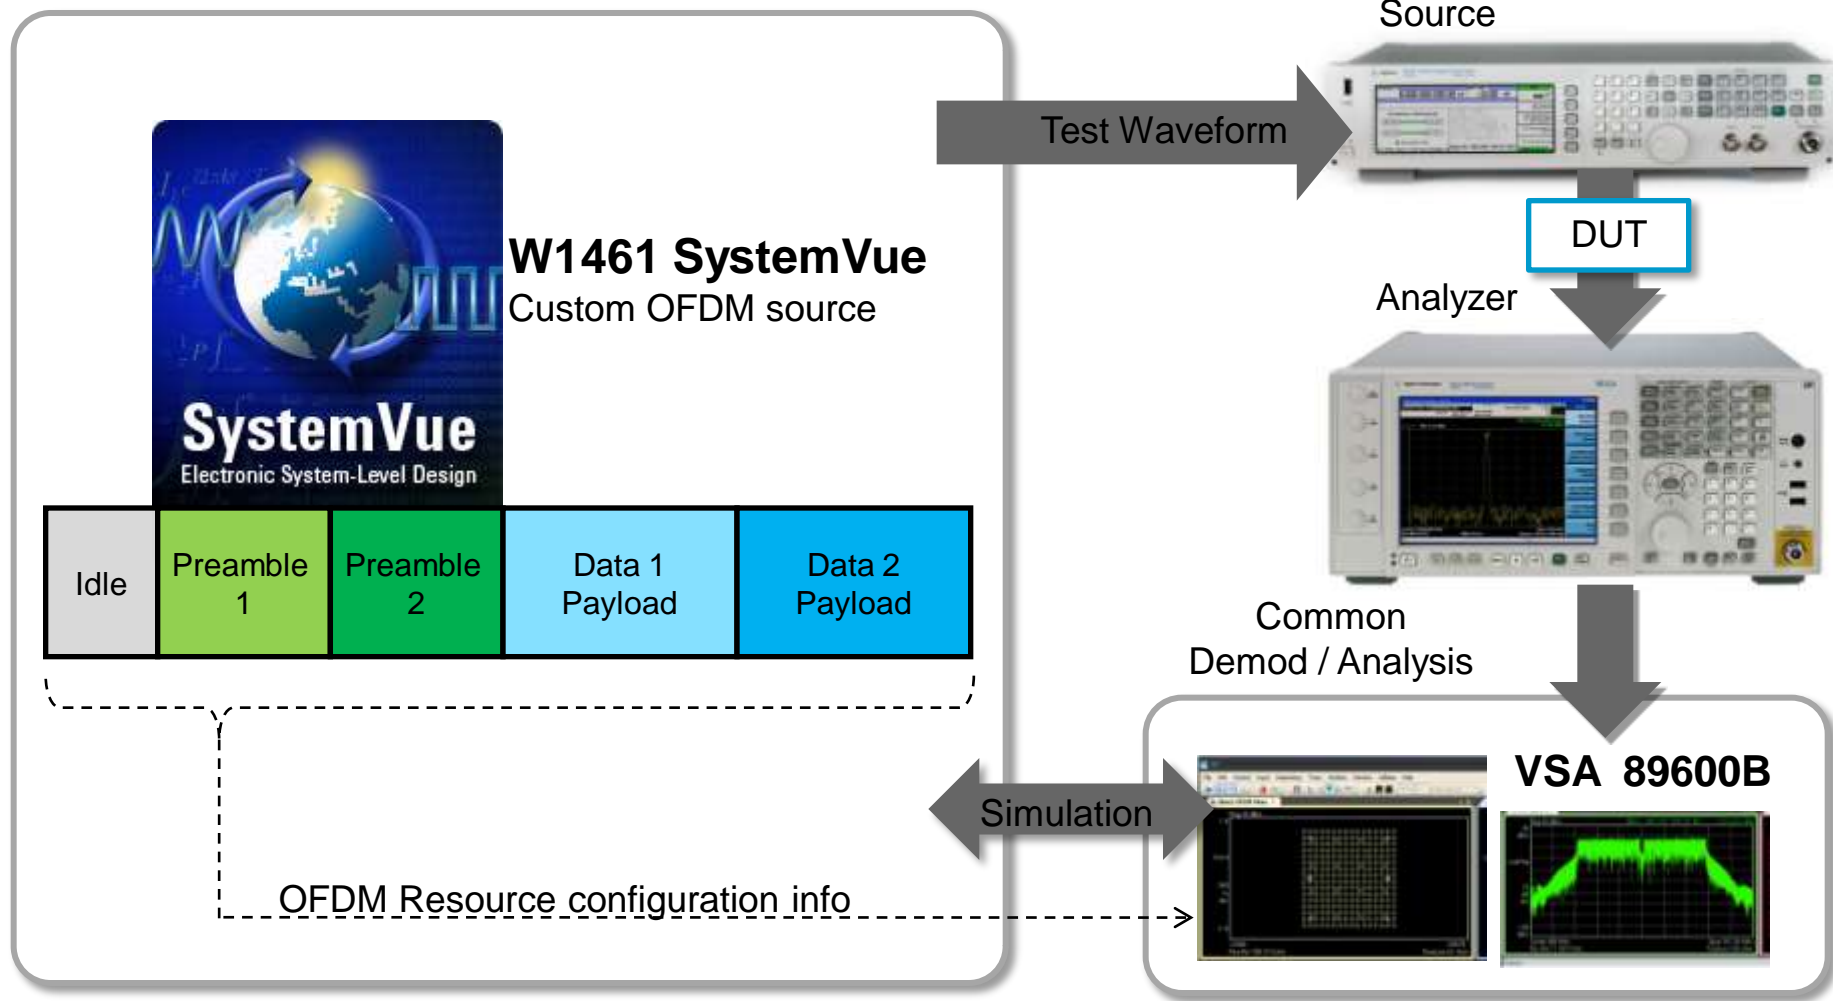

- **Resource Modulation.txt** – Describes modulation format for each subcarrier.
- **Preamble I-Q.txt** – expected IQ value for each preamble subcarrier.
- **Pilot I-Q.txt** – expected IQ value for each pilot.

## Features to simplify configuration

- **Auto-detect pilot I-Q** – can eliminate Pilot I-Q file
- **Auto-detect data subcarrier modulation format** – simplify Resource Mod file
- **Loop continuously through last N symbols** – shorter config files
- **Modulation format table** – modify all data subcarrier modulation formats simultaneously, by changing one value in table.

Should Know  
about MIMO”

## Ten Things You Should Know About MIMO

Agilent is committed to helping you understand MIMO technology so you can get your products to market fast. We will provide you with the design and test solutions you need, when you need them. So, as you take MIMO forward, Agilent clears the way.

### MIMO is used differently in the downlink and uplink of cellular systems.

MIMO downlink uses multiple transmit antennas to send data to a single receiver antenna. MIMO uplink uses a single transmit antenna to send data to multiple receiver antennas.

### MIMO needs at least two transmitters and two receivers, and the antennas have to be in the same plane.

Think of the configuration as a 2D plane. The antennas have to be in the same plane. The antennas have to be in the same plane. The antennas have to be in the same plane.

### MIMO signal recovery is a two-step process.

1. Recover the channel coefficients.
2. Separate the signals and demodulate.

The first step is to recover the channel coefficients. The second step is to separate the signals and demodulate.

### Transmit and receive phase differences don't affect open loop MIMO.

Phase differences between antennas do not affect the performance of open loop MIMO. The performance is determined by the number of antennas.

### The combination of BS and MS antenna configuration has a major impact on channel path correlation.

The combination of base station (BS) and mobile station (MS) antenna configuration has a major impact on channel path correlation. The correlation is determined by the geometry of the antennas.

### MIMO needs a better carrier-to-noise ratio than SISO.

MIMO requires a higher carrier-to-noise ratio (CNR) than single-input single-output (SISO) systems. The required CNR is determined by the number of antennas.

### Pre-coding and eigenbeamforming couple the transmit signals to suit the channel.

Pre-coding and eigenbeamforming are techniques used to couple the transmit signals to the channel. They improve the performance of MIMO systems.

### Cross-channel measurements can be made with a single-input analyzer, using the reference signals (pilots).

Cross-channel measurements can be made with a single-input analyzer by using reference signals (pilots). This allows for the measurement of the channel between different antennas.

### Condition number measures short-term MIMO channel performance.

The condition number is a measure of the short-term performance of a MIMO channel. It is determined by the ratio of the largest and smallest singular values.

### Distortion in one component can degrade all the data streams.

Distortion in one component of a MIMO system can degrade the performance of all the data streams. This is because the streams are coupled.
